

Drug for COVID-19 Patients – level 1

Researchers at the University of Albany in the USA are **studying patients** with COVID-19. These patients get a special drug. Doctors usually use this drug to **treat** people with malaria. Malaria is a sickness that people get from Mosquitos.

In the past, the US president, Donald Trump, said that the drug could be good for COVID-19 patients, too.

Researchers are studying 1,400 patients. They got the drug. However, they did not **get better**. It seems that the drug does not help them.

The **result** of the study is not **official**. There must be another study. It must follow official rules.
