

Fish from a lab – level 1

A company in San Francisco, USA, is making salmon meat. They grow the meat in a **lab**.

The meat looks and tastes like real salmon. It is a similar color, too. It is not possible to buy it in a shop now. The company is not very big yet. However it seems that it will be possible in the future.

Salmon is the most popular fish in the world. **Sadly**, the number of wild fish in the oceans is going down quickly. **Salmon farms** are in trouble because sea water is getting warmer.

Another problem is that water in the oceans is not clean. There are dangerous metals and **microplastics** in the water. They get in the fish meat. Then, people eat it.

Salmon meat from the lab is clean. Also, it is as **healthy** as real salmon.
